

CASE STATEMENTS AND CTE

KEYWORD : WHEN , THEN

Query

Create a new column named
"CourseFeeStatus"

Conditions:

CourseFee > 3999 → Expensive Course

CourseFee > 1499 → Moderate Course

Else → Cheap Course

SYNTAX:

SELECT CourseId, CourseName, CourseDuration,
CourseFee,

Conditions

CASE

WHEN CourseFee > 399 THEN 'Expensive Course'

WHEN CourseFee > 1499 THEN 'Moderate Course'

ELSE 'Cheap Course'

END AS CourseFeeStatus

FROM Courses.

CASE EXPRESSION

SELECT CourseID, Course Name, Course Fee

CASE

CourseFee

→ categorize on the basis of which column

WHEN 4999 THEN 'Premium Course'

WHEN 3999 THEN 'Plus Course'

WHEN 2999 THEN 'Regular + Course'

ELSE 'Regular Course'

END as CourseType

FROM Courses

When to use what

① Whenever Comparison, Conditions
→ CASE STATEMENTS

② If the exact {num} matches then
do this

→ CASE EXP

Conditional Statements

If - Else

WHEN - THEN

Conditional statements

will not have nothing to do with time complexity

Loops

(Higher loops) → Time complexity ↑
For, while, Do while

subqueries → More num of subqueries makes increase the time complexity

CTE (Common Table EXP)

- Used in dealing with Complex queries
- to make code understandable and readable.

→ Reusability

OVER()

↳ Display the results for the entire num of records we have

Eg: AVG(SUM(totalOrder)) OVER()

for all GROUP BY records

→ At First just AVG() or SUM()

gives a single value when we are using. But in this case we have display the result of AVG() for all records that we have. So we are using OVER()

SELECT temp.Order_LearnerId, FirstName, LN,
temp.total_orders, AVG(SUM(temp.totalOrders))
OVER() as Avg-Orders

FROM

(SELECT order_LearnerId, COUNT(*) AS totalOrders
FROM Orders
GROUP BY order_LearnerId) as temp

JOIN

LEARNERS

ON

temp.Order_LearnerId = Learners.LearnerId

GROUP BY temp.Order_LearnerId

P₁, P₂, GROUP BY, select P₃ P₄

→ After joining the temp table &
Learners table, then group it to avoid
duplicates, then select it

→ discussed in .sql files
